CROP VALUES

Season Average Prices and Value of Production, by States, 1956 and 1957

Estimated season average prices and value of production for all major farm crops and for many minor crops are presented in this report. The season average prices shown in this report are estimates of the average price received by producers for that part of the crop that is sold and are applied to the production estimates presented in Crop Production--1957 Annual Summary to compute the value of production. All estimates for the 1957 crop are preliminary.

For the major crops the season average price is computed by weighting mid-month prices by estimated monthly marketing percentages. For other crops, monthly price estimates are not prepared and for these the season average price is based on special survey data. For certain crops a December 1 price is used to value the crop. The season average prices for corn, wheat, rye, rice, oats, barley, sorghum grain, flaxseed, soybeans, dry beans, cotton lint and cottonseed include an allowance for unredeemed loans and purchase agreement deliveries valued at the average loan rate, by States. The 1957 price for cotton is the average price to December 1. For dry beans and dry peas the price and value estimates relate only to production of cleaned beans or peas.

In this report, the United States average price is obtained by weighting State prices by production. The value estimates relate to the crop harvested in the specified year and should not be confused with cash receipts which relate to sales during a calendar year irrespective of the year of production.

Summary of Crop Values, United States, 1956 and 1957

Crop	Unit	Price		Value of production	
		1956	1957	1956	1957
		Dollars	Dollars	dollars 1,000	dollars 1,000

1/ Estimates for each State cover all potatoes, including winter, early spring, late spring, early summer, late summer, and fall crops where grown. The value of production for all potatoes is the sum of the value of production of the seasonal groups. For States having two or more seasonal groups the State average price is derived by dividing value of sales by total sales and may not give the same average as dividing total value of production by total production. 2/ Some quantities not harvested or not marketed because of low prices are included in the production estimate but excluded in computing value.

1/ Price and value apply only to that portion of the crop utilized.

2/ The season average price is the composite average of the price of fruit in the f.o.b. position packed for fresh consumption, the price of fruit sold locally in loose pack, and the p.h.d. price of bulk fruit sold to processors.

3/ The season average price is the price for bulk fruit at first delivery point.
